

CASE STUDY

Skill Builder Tool Development

A self-service tool for creating personalized development plans

The Challenge

Frontline employees needed a simple way to identify a skill they wanted to develop and turn that choice into an actionable development plan. The goal was to create a guided, self-service experience that made development planning easy to understand, personalize, and revisit over time.

My Approach

I designed and developed the Skill Builder in Articulate Storyline as used my UX and UI background to create a simple and guided three-step experience. The tool walks employees through selecting a skill, building a development plan, and downloading a PDF copy of the completed plan.

After an employee selects a skill, the tool presents development opportunities organized around the 3E model: Experience (70%), Exposure (20%), and Education (10%). Employees can select individual opportunities with checkboxes and build a plan that reflects their own development needs.

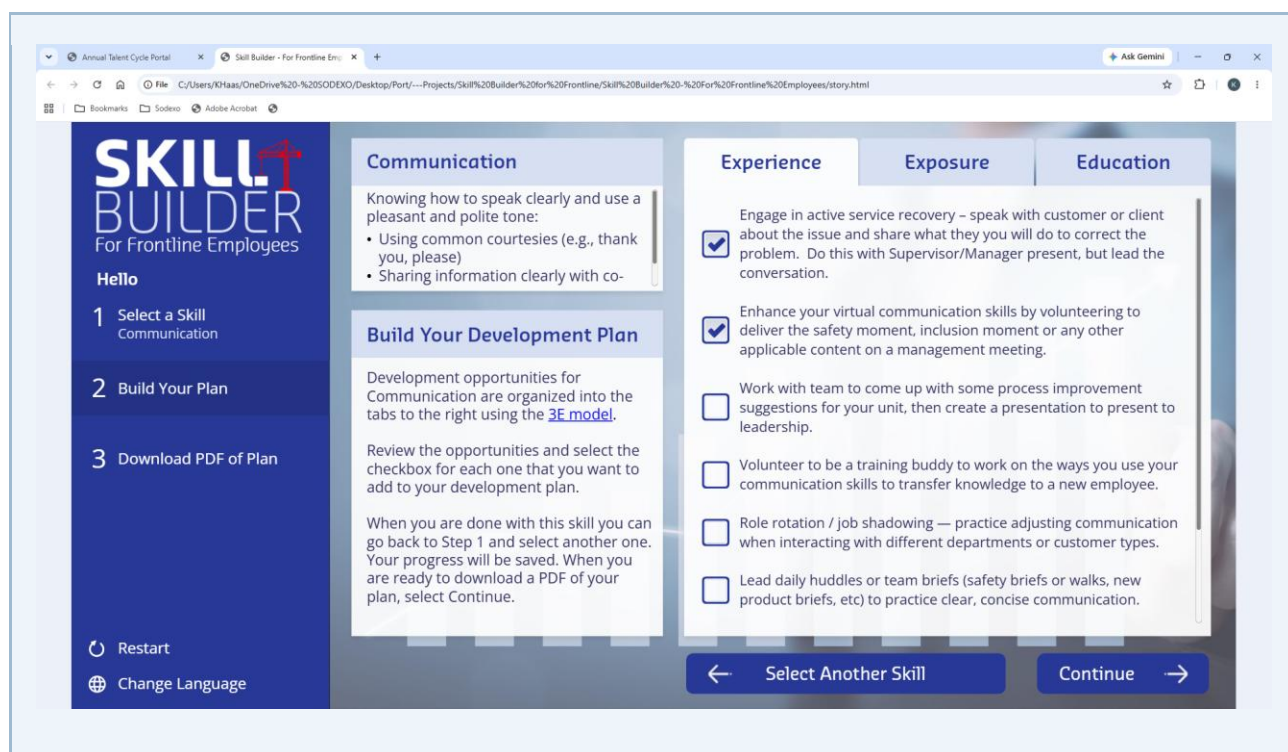

Technology & Development

ARTICULATE STORYLINE Primary development platform for the workflow, skill selection, interactions, checkboxes, variables, triggers, and progress functionality.	VARIABLES & TRIGGERS Configured for each development opportunity to capture, display, and save checkbox selections as part of the employee's plan.
JAVASCRIPT + PDFMAKE Used the pdfmake JavaScript library to dynamically generate the PDF from Storyline variables containing the selected opportunities.	PERSISTENT PROGRESS Saved employee selections between sessions so plans could be revisited, updated, and completed over time.
XAPI / LRS REPORTING Used xAPI and a Learning Record Store (LRS) to track the development plans created through the tool and built reporting dashboards to analyze plan activity and the development opportunities employees selected.	

Learner Experience

The Skill Builder guides employees through three steps: 1) Select a Skill, 2) Build Your Plan, and 3) Download PDF of Plan. The simple structure keeps the experience focused and easy to follow.

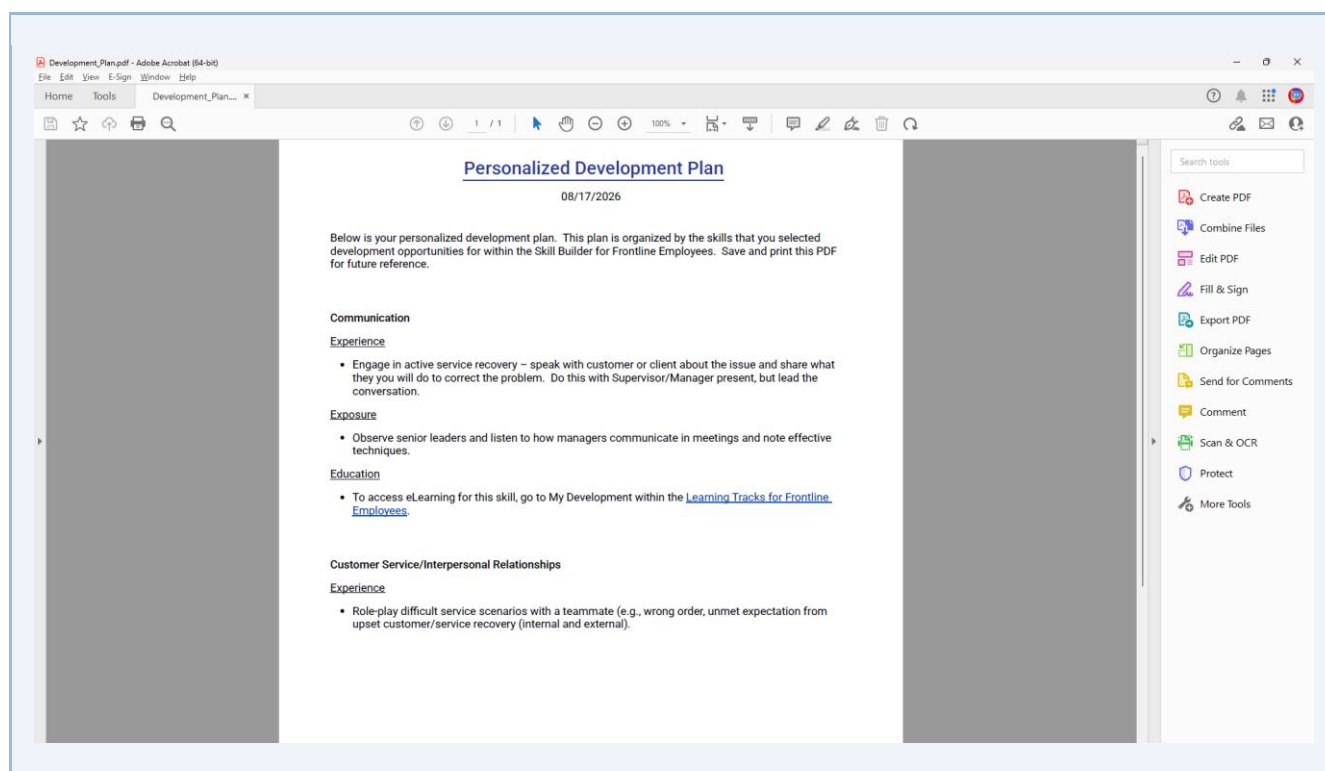

After selecting a skill, employees review Experience, Exposure, and Education opportunities and use checkboxes to add the activities they want in their plan. Their selections persist between sessions so they can return later and update the plan, while xAPI and LRS reporting provide visibility into the plans created and the development opportunities selected.

Behind the Experience

SELECT A SKILL Choose from available skills	BUILD YOUR PLAN Select 3E opportunities with checkboxes	DOWNLOAD PDF OF PLAN Generate a personalized PDF
---	---	--

Conceptual flow: employee selects a skill → Storyline variables and triggers track selections → selected values are stored and used to maintain progress → xAPI records plan activity in the LRS → LRS reporting dashboards track and analyze development plans → selected values are passed to a pdfmake HTML page → JavaScript dynamically generates the PDF.

Business Impact

- Created a simple, self-service experience that guided frontline employees from skill selection to a completed development plan.
- Used the 3E model to organize development opportunities into Experience, Exposure, and Education.
- Enabled employees to build and revisit personalized plans by saving checkbox selections between sessions.
- Used xAPI and LRS reporting dashboards to track and analyze the development plans created through the tool and identify patterns in employee selections.
- Added dynamic PDF generation so employees could download a portable copy of their completed plan.

What I Learned

This project strengthened my ability to use Articulate Storyline as an application-development platform rather than only as a course-authoring tool. It also demonstrated how Storyline variables, triggers, JavaScript, and an external library such as pdfmake could be combined to create a practical, personalized digital learning tool.
