

CASE STUDY

eLearning Course

Designed and developed a custom eLearning course in Articulate Storyline.

The Challenge

A PDF resource containing information and graphics about company values was provided as the starting point. The challenge was to transform that source material into an engaging digital learning experience rather than a simple read-and-click-next course.

My Approach

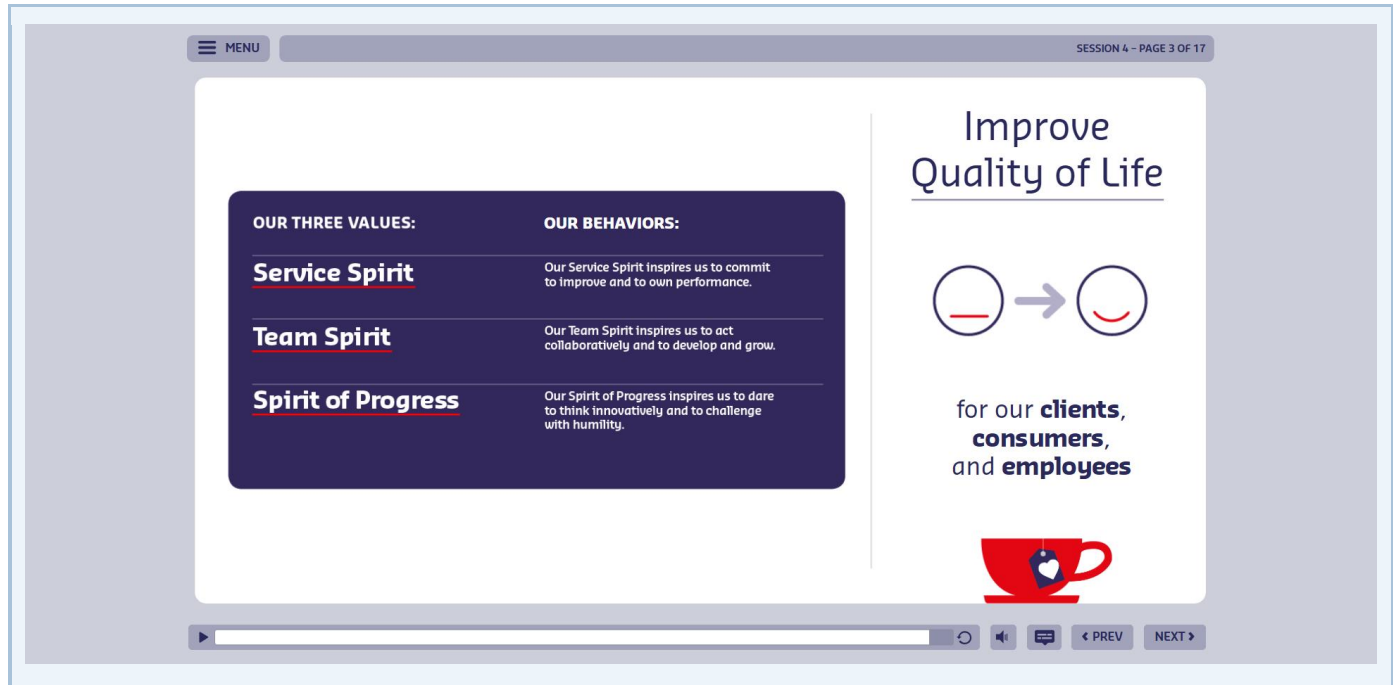

I first reviewed the source material and developed a content outline, script, and storyboard that translated the information into a cohesive learning experience. I planned where narration, animation, on-screen text, graphics, and reflection activities would work together to reinforce the key concepts.

I then created a visual mockup for the overall user interface and user experience and used it as the design foundation for the course. The final course was developed in Articulate Storyline with a custom interface and interactive elements designed to keep learners engaged with the content.

Course Design & Learner Experience

The course used voice-over narration combined with animated graphics and text timed to the narration. Rather than presenting large amounts of text for learners to read, the experience revealed information progressively and used movement and visual emphasis to support the spoken content.

The custom user interface established the overall look and feel of the course. I designed the interface in Storyline based on the initial visual mockup.

Navigation & Progress Tracking

I developed a custom menu that learners could open at any time to view a list of all course pages. Each page included a check mark to indicate completion. A Storyline variable controlled the completion state for each page, allowing the menu to function as both a navigation tool and a visual progress indicator.

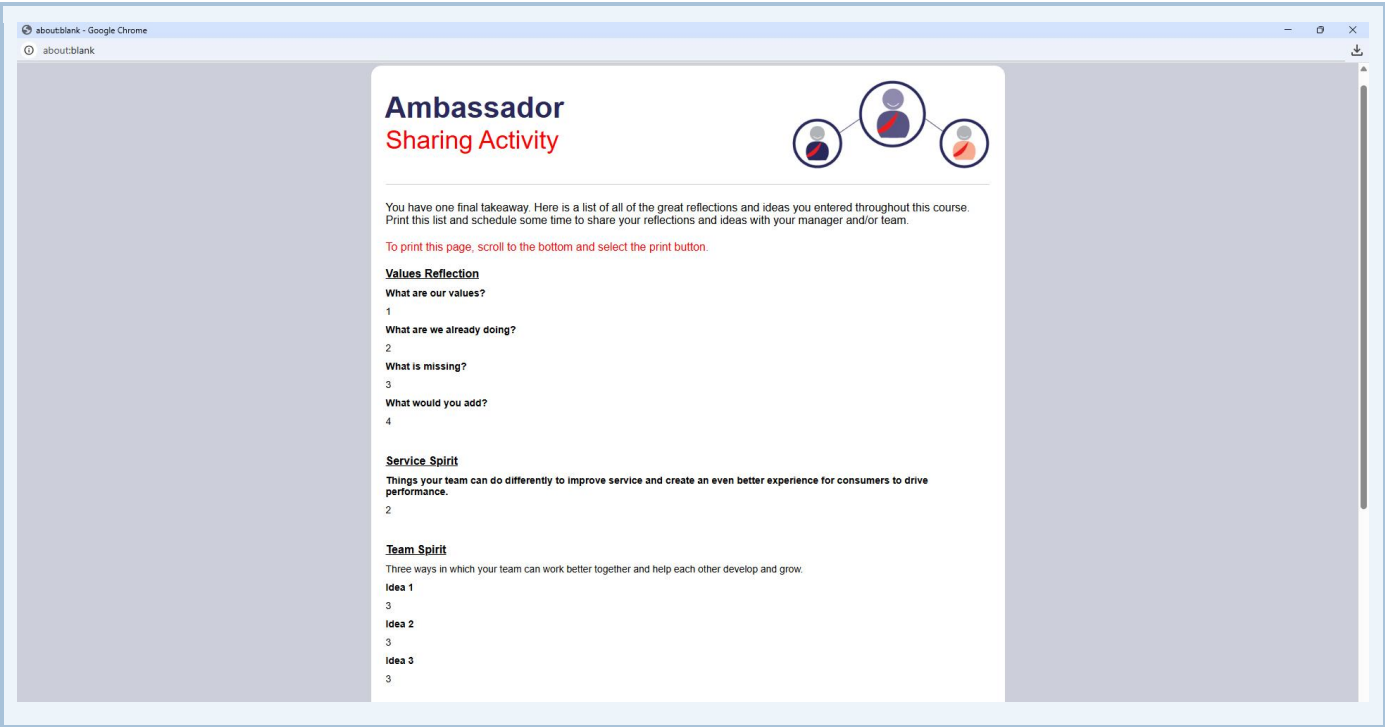

Reflection & Personalized Learning Output

After key content was presented, the course included reflection questions that encouraged learners to think about how the concepts related to their own work and behavior. Learners entered their responses into text boxes and their entries were stored in Storyline variables.

At the end of the course, the learner could review their reflections and print them. HTML and JavaScript were used to create a dynamic HTML page that pulled the Storyline variable values into the page and formatted them for printing. This turned the learner's responses into a personalized take-away from the course.

Technology & Development

ARTICULATE STORYLINE Primary development platform for the course, custom interface, navigation, variables, triggers, text-entry interactions, and progress functionality.	CUSTOM UI / UX Visual mockup and custom interface design established the course look and feel and supported a consistent learner experience.
ANIMATION & NARRATION Combined voice-over narration with animated graphics and timed text to create a more engaging experience than a traditional read-and-click course.	VARIABLES & TRIGGERS Configured variables to control page completion states and capture reflection responses.
HTML + JAVASCRIPT Used to create a dynamic web page that received Storyline variable values and presented learner reflections in a print-ready format.	

Business Impact

- Transformed static source material into a more engaging digital learning experience using narration, animation, custom interaction, and reflection.
- Created a custom Storyline interface that gave the course a distinctive look and feel and provided clear navigation and progress visibility.
- Designed an experience that encouraged learners to connect company values to their own work through guided reflection questions.
- Used variables and triggers to manage page completion and preserve learner reflection responses for use later in the course.
- Created a personalized end-of-course reflection output by passing Storyline variable values into a dynamic HTML page with JavaScript.

What I Learned

This project strengthened my ability to combine instructional design, visual design, Storyline development, animation, and custom web functionality into a cohesive learning experience. It also demonstrated how Storyline variables, triggers, HTML, and JavaScript could extend a course.
